

Toggle Visibility

Do you want a button to hide a layout or control, then the next time to show it again?

Call this function.

[togglevis.js](#)

```
function toggleVisibility(control, gone)
//param1 is a control or layout
//param2 true=Gone, false=Hide (default false)
{
    if(control.GetVisibility()=="Show")
    {
        control.SetVisibility(gone?"Gone":"Hide")
    }
    else
    {
        control.SetVisibility("Show")
    }
}
```

Note

If you pass **true** as the second parameter, when the control is hidden, it will be set to **Gone**.
If the second parameter is missing or **false** the visibility mode will be **Hide**
